

Trends in growth, rwp and photosyn

Objective: To see if CO₂ mesophyll resistance (rwp) is related to total growth traits.

Data limitations: photosynthesis related traits are from greenhouse and growth characteristics are from field.

Growth data files: Corv_2012_Growth_rep1.csv, Corv_2012_Growth_rep2.csv, Corv_2012_Growth_rep3.csv, GWAS_Clatskanis_july_2013_Height_Diameter.csv

Photosyn data files: datainput_2_27_2015.csv

Local Git directory: setwd("~/GitHub/poplar_GWAS_photosyn")

```
##
## Attaching package: 'dplyr'
##
## The following object is masked from 'package:stats':
##
##     filter
##
## The following objects are masked from 'package:base':
##
##     intersect, setdiff, setequal, union
```

Field Traits

HBS3 Height to the bud scar of year 3 (2011 height)

HBS2 Height to the bud scar of year 2 (2010 height)

HHB height to the highest branch columns F-M are mostly repeated, but with 4 noted trees. What are they for? D20 diameter 20cm

D50 diameter 50cm - for stem taper

BA Branch angle

SB sylleptic branches from last year's growth (2011)

LENT # lenticels in 5cm along trunk

Tephрина 0-4: 0=zero; 1=1-25%; 2=26-50%; 3=51-75%; 4=76-100%

Venturia 0-4: 0=zero; 1=1-25%; 2=26-50%; 3=51-75%; 4=76-100%

Data manipulation and Gm calculation Note: can only calculate Gm for samples that have rwp > 0.
